Replacing the Cypress CY14B101LA-xx nvSRAM with Everspin’s MR0A08Bxxx MRAM

GENERAL CONSIDERATIONS for REPLACING nvSRAM with MRAM

Every write with an Everspin MRAM is instantly non-volatile for at least 20 years. There is no transfer of data from a volatile to a non-volatile memory cell, no external capacitors or back up batteries. The elimination of external components, highly reliable data retention, and 35ns SRAM compatible READ/WRITE Access times make the Everspin MRAM a viable candidate for replacing the Cypress CY14B101LA-xx nvSRAM without compromising system performance.

EVERSPIN MRAM MEMORY

Everspin is the global leader in commercially viable MRAM technology and Everspin MRAM products are present in dozens of applications demanding high-speed, reliable, non-volatile memory.

MR0A08B COMPARISON TO CY14B101LA

The Everspin MRAM solution provides:

- Always Non-Volatile. No Unreliable Capacitor Dependent Backup Cycles
- No Vcap or Vbatt required
- Immediate (<1ns) Power-off with no loss of data
- No complex Software STORE/RECALL routines
- Fast Star-up time (2ms vs. 20ms)
- Unlimited Read and Write cycles - No Wear-out Concerns
- 20-Year Data Retention with No Cycling Dependence
- Fewer components means smaller design footprint and lower total BOM cost
- Directly replaces the Cypress nvSRAM

COMPATIBILITY

The Everspin MR0A08BCYS (44-TSOP2) is pin and timing compatible with the Cypress CY14B101LA-ZS.

TIMING COMPATIBILITY

Both Everspin MRAM and nvSRAM have standard, compatible asynchronous SRAM timing. The MRAM however, retains data even at power off for an indefinite period of time and over temperature cycling. With a 35 ns read/write cycle time, the MRAM is compatible with similar nvSRAM speed grade options.
Replacing the Cypress CY14B101LA-xx nvSRAM with Everspin’s MR0A08Bxxx MRAM

It is important to note that the Everspin MR0A08Bxxx device requires a minimum of 12ns hold time from Write Enable (and Chip Enable) high to Address invalid (Please see TWHAX and TEHAX in the MR0A08B data sheet available here,). Most microprocessors can accommodate this Hold time.

PIN COMPATIBILITY

- 1Mb organized in the 128Kx8 configuration
- 3.3 volt nominal operation
- Standard SRAM parallel address pins (A0-16)
- Standard byte-wide, bidirectional data pins (DQ0-7)
- Standard control signals (/E, /W, /G)

The MR0A08B does not require an external capacitor and the other associated passive components required by the CY14B101LA-xx devices.

The differences between the Cypress and Everspin devices are the two pins on the nvSRAM: VCAP and /HSB. These pins are used to support the nvSRAM backup cycle and are not required for operation of the MRAM.

VCAP pin
A capacitor is required on the VCAP pins (Pin 30 on the TSOP2, Ball E3 on the BGA) on nvSRAM devices. Everspin assigns a “Do not connect” (DC) to the corresponding pins on the MRAM. When replacing the Cypress nvSRAM with the Everspin MRAM, it is recommended that this pin be either left floating or kept at Vss. If a capacitor or VDD is connected to this pin, it will have no effect on MRAM operation. However, the device may draw more current than if this pin is pulled to Vss or left floating.

/HSB pin
The /HSB pin of the nvSRAM (Pin 44 of the TSOP2, Ball G2 on the BGA) is used to either initiate a Hardware Store or indicate a Hardware Store is in process. The pin 44 on the MRAM TSOP2 is recommended “Do not connect”.

In the case of pin 44 on the TSOP2 package, the MRAM has a static pull-down to Vss. Consequently, a Host processor should not expect the MRAM to drive this pin to a high state.

Replacing the Cypress CY14B101LA-xx nvSRAM with Everspin’s MR0A08Bxxx MRAM

**Package Dimensions**

The Everspin 44 pin TSOP2 device is drop in compatible with the corresponding Cypress equivalents. However, see Figures 3 and 4 to understand the package dimension differences between the Cypress and Everspin FBGA packages. Make special note of the package dimension differences requiring different mechanical “Keep out” areas for these packages.

OTHER REPLACEMENT DESIGN CONSIDERATIONS

**HSB SOFTWARE**

Due to its persistence, there is no power monitoring requirement for the Everspin MRAM as is the case with the nvSRAM. Therefore, initiating or monitoring Hardware Stores, Restores and associated software routines are unnecessary and can be eliminated.

**SIMPRESSED POWER CYCLING**

When power is removed from the MRAM, data remains indefinitely over time and temperature until re-programmed. This feature, unique to MRAM, allows for Duty Cycle Power control enabling the user to reduce their overall power consumption without the concern of wear-out.

MRAM requires control signals /E and /W to track the power supply during power-up and be held high for a 2 ms start-up period much shorter power-up requirement than the nvSRAM. When power fails, the Everspin MRAM simply inhibits write operations and no special power down timing considerations are needed since data is always non-volatile.

The nvSRAM device requires the /WE signal to track the power supply during power-up and be held high during the power-up recall period of 20 ms. The nvSRAM must sense the power failure, decouple the power supply from its backup capacitor, wait for any SRAM operations to complete, and then perform a parallel write to the EEPROM storage element during the 8 ms period after power has failed. This sequence is complicated by the fact that power falls at various ramp rates and in some cases bounces above and below the power supply threshold (brown outs) in rapid succession. Thus raising concerns about reliability of the backup storage cycle under all system power conditions including some that cannot easily be simulated or tested.

Additionally, there may be concern with wear-out of nvSRAM EEPROM storage element which is limited to just 200K cycles. Everspin MRAM supports unlimited read, write, and power cycles. There are no wear-out concerns with MR0A08Bxxx.

**POWER-UP SEQUENCING**

Both MRAM and nvSRAM will operate from a standard +3.3 volt power supply with +/-10% power supply range. Both MRAM and nvSRAM have similar standby and active operating currents, however, the “Start-up” time for the MRAM is 2ms vs. 20ms for the nvSRAM. Proper decoupling capacitors should be used to assure reliable operation.
RELIABILITY CONSIDERATIONS FOR COMPARISON

CY14B101LA-xx uses conventional trapped charge technology for non-volatile storage. Data can leak away as wear-out results from temperature and excessive write cycles. Engineers must carefully design systems using nvSRAM to avoid exceeding the non-volatile write limitation of 200K cycles.

Everspin MRAM will provide the most cost effective non-volatile RAM solution. The nvSRAM is constructed by combining a standard 6-transistor SRAM with a non-volatile EEPROM storage element in every cell. The total cell complexity is 12-transistors. MR0A08Bxxx is built using a much simpler 1-transistor, 1-magnetic tunnel junction cell. The simple Everspin MRAM cell leads to improved manufacturing efficiency and increased reliability.
Replacing the Cypress CY14B101LA-xx nvSRAM with Everspin’s MR0A08Bxxx MRAM

The reliability of an nvSRAM is dependent upon not only the memory chip but also the quality of the external VCAP capacitor. Careful capacitor selection is necessary to assure reliable power sequencing.

MRAM uses magnetic tunnel junction technology for non-volatile storage. Data does not leak away at high temperature and there is no wear-out mechanism to limit the number of read, write, or power cycles in this technology. Data retention is better than 20 years at 125 °C.
